AI UPDATE

What if your agent joined the team?

DeepSeek's Super-agent prototype

Asked directly, or allowed by team rules.

Research prototype. Not production-ready.

AI UPDATE

A new kind of team workflow

One GitHub repository. Optional Feishu.

INPUTS

GitHub activity

Feishu messages

AUTHORITY

Allowed person or team rule

WORK ITEM

Agent works in its own session and directory.

Inputs alone do not grant permission.

AI UPDATE

From request to result

A conceptual path through the prototype

01 REQUEST

An allowed person asks for work.

02 WORK

The agent opens a work item.

03 RESPONSE

It replies in the original thread, for example with a pull request.

A web panel shows what needs a person.

AI UPDATE

The important part: boundaries

A team decides what the agent may do.

WHO CAN REQUEST?

The host checks allowed people and source policies.

WHEN CAN IT ACT?

When asked, or when a team rule permits the work.

Messages do not change permissions.

Permission is a design decision.

AI UPDATE

Promising idea. Early code.

What would you let an agent do?
